

GeckoSystems Responds to Heightened Chinese Personal Robot Interest

CONYERS, Ga., Sept. 15, 2009 (MARKETWIRE via COMTEX) -- GeckoSystems Intl. Corp. (Pink Sheets: GCKO | <http://www.geckosystems.com/>) -- announced today that due to increased inquiries from mainland China by prospective joint venture partners, that they are considering adding a second Chinese business developer to represent them in China. GeckoSystems is a dynamic leader in the emerging mobile robotics industry revolutionizing their development and usage with "Mobile Robot Solutions for Safety, Security and Service(tm)."

"As all of us here at GeckoSystems are excited about this development, due to the nature of the upcoming discussions I feel it is in the best interest of all parties involved to withhold the name of the new Chinese company inquiring at this time. They are headquartered in Xujiahui, Shanghai's famous business area. Their probable interest is due to not only our flagship product, our proprietary automatic self-navigation software, GeckoNav(tm), but also the reality that we have a complete multitasking personal companion robot, the CareBot(tm), with verbal interaction and 'command and control' capabilities, GeckoChat(tm), and the ability to routinely follow a designated family member with GeckoTrak(tm).

GeckoSystems' increasing visibility in China and the continuing positive reaction to our innovative mobile robot solutions and products allows GeckoSystems the opportunity to become established as a significant player in China with the right partners to supply cost effective solutions for security, eldercare, etc. and to develop other products tailored for the Chinese marketplace and the rest of the world," stated R. Martin Spencer, President/CEO.

The Guangzhou Industrial Development President, Mr. Luo stated, "We look forward to GeckoSystems' visit to demonstrate. Guangzhou, China is a portal to the Chinese robotic world and has vast resources. We can help GeckoSystems accelerate its product development and enhance its competitive advantage, cost-effectively, so that GeckoSystems can meet not only China requirement but also the world market demands," Mr. Luo added.

"SIASUN has always been devoted to the development of state of the art robotic technologies. We continually work to put our excellent science and technology into the real work force. I look forward to our joint mobile robot development work with GeckoSystems," stated Dr. Fang Xu, Director.

GeckoSystems has projected the Pacific Rim personal robot sales forecasts in the eldercare markets for the years 2010 to 2014. For over ten years the company has had numerous market size discussions with significant international firms in China, Japan, South Korea, Hong Kong, and Taiwan. The Delphi market research methodology indicates two disparate markets in China: One is the very large market segment (i.e. many millions of families) of new millionaires looking to make prestige purchases of new Buicks, etc. Last month GM sold over 38,000 Buicks in China. At an annual run rate of over \$10B, these prestige purchasers are very profitable for GM and can be for GeckoSystems. The other significant Chinese market is for care of the 20,000,000 plus elderly living in dormitories due to their only child working in the industrialized cities. These two market segments alone indicate a Chinese marketplace of several billions of dollars in the next five to seven years.

In the last decade, the Japanese government has granted over \$100M in aggregate R&D funding to their leading international manufacturers to develop personal robots suitable for eldercare, yet no viable solutions have been developed. Sources within the Japanese government project their domestic market to range from \$26B in 2010 and to nearly \$70B by 2025 for personal robots.

"Consequently, at minimum, we project the available Pacific Rim market size in dollars for cost effective, utilitarian, multi-tasking personal robots suitable for eldercare in 2010 to be \$22.0B; in 2011 to be \$23B; in 2012 to be \$24B; in 2013 to be \$25B; and in 2014 to be \$26B. With market penetrations of 0.009% in 2010, 0.024% in 2011, 0.077% in 2012, 0.29% in 2013, and 0.61% in 2014, we expect international sales, from

these consumer markets only, of \$2.0M, \$5.5M, \$18.5M, \$72.6M, and \$158.6M, respectively," predicted Spencer.

About SIASUN Robot & Automation Co., Ltd.:

The Company's major investor and sponsor is the Shenyang Institute of Automation by the Chinese Academy of Science. It is "National Robot Engineering Research Center" invested by the Nation Development Planning Commission, "National High-tech '863' Program Intellectual Robot Industrialization Base" and "National Hi-tech Research Result Industrialization Base" by the Science and Technology Ministry. It was the first enterprise to pass the international verification of ISO9001 system in Chinese Robot Industry.

About GeckoSystems International Corporation:

Since 1997, GeckoSystems has developed a comprehensive, coherent, and sufficient suite of hardware and software inventions to enable a new type of home appliance (a personal robot) the CareBot(tm), to be created for the mass consumer marketplace. The suite of primary inventions includes: GeckoNav(tm), GeckoChat(tm) and GeckoTrak(tm).

The primary market for this product is the family for use in eldercare, care for the chronically ill, and childcare. The primary distribution channel for this new home appliance is the thousands of independent personal computer retailers in the U.S. The manufacturing infrastructure for this new product category of mobile service robots is essentially the same as the personal computer industry. Several outside contract manufacturers have been identified and qualified their ability to produce up to 1,000 CareBots per month within four to six months.

The Company is market driven. At the time of founding, nearly 12 years ago, the Company did extensive primary market research to determine the demographic profile of the early adopters of the then proposed product line. Subsequent to, and based on that original market research, they have assembled numerous focus groups to evaluate the fit of the CareBot personal robot into the participant's lives and their expected usage. The Company has also frequently employed the Delphi market research methodology by contacting and interviewing senior executives, practitioners, and researchers knowledgeable in the area of elder care. Using this factual basis of internally performed primary and secondary market research, and third party research is the statistical substance for the Company's sales forecasts.

Not surprisingly the scientific statistical analyses applied revealed that elderly over sixty-five living alone in metropolitan areas with broadband Internet available and sufficient household incomes to support the increased costs were identified as those most likely to adopt initially. Due to the high cost of assisted living, nursing homes, etc. the payback for a CareBot(tm) is expected to be only six to eight months while keeping elderly care receivers independent, in their own long time homes, and living longer due to the comfort and safety of more frequent attention from their loved ones.

Using U.S. Census Bureau data and various predictive statistical analyses, the Company projects the available consumer market size in dollars for cost effective, utilitarian, multitasking eldercare personal robots in 2010 to be \$74.0B, in 2011 to be \$77B, in 2012 to be \$80B, in 2013 to be \$83.3B, and in 2014 to be \$86.6B. With market penetrations of 0.03% in 2010, 0.06% in 2011, 0.22% in 2012, 0.53% in 2013, and 0.81% in 2014, we will anticipate CareBot sales, from this consumer market segment, only, of \$22.0M, \$44.0M, \$176M, \$440.2M, and \$704.3M, respectively. The Company expects these sales despite --and perhaps because of-- the present recession due to pent up demand for significant cost reduction in eldercare expenses.

The foregoing forecasts do not include sales in non-metropolitan areas; elderly couples over 65 (only elderly living alone are in these forecasts); those chronically ill --regardless of age-- or elderly living with their adult children.

The Company's "mobile robot solutions for safety, security and service(tm)" are appropriate not only for the consumer, but also professional healthcare, commercial security and defense markets. Professional healthcare require cost effective, timely errand running, portable telemedicine, etc. Homeland Security requires cost effective mobile robots to patrol and monitor public venues for weapons and WMD detection. Military users desire the elimination of the "man in the loop" to enable unmanned ground and air vehicles to not require constant human control and/or intervention.

The Company's business model is very much like that of an automobile manufacturer. Due to the final assembly, test, and shipping being done based on geographic and logistic realities; strategic business-to-business relationships can range from private labeling to joint manufacturing and distribution to licensing only.

Several dozen patent opportunities exist for the Company due to the many innovative and cost effective breakthroughs embodied not only in GeckoNav, GeckoChat, and GeckoTrak, but also in additional, secondary systems that include: GeckoOrient(tm), GeckoMotorController(tm), the GeckoTactileShroud(tm), the CompoundedSensorArray(tm), and the GeckoSPIO(tm).

The present senior management at GeckoSystems has over thirty-five years experience in consumer electronics sales and marketing and product development. Senior managers have been identified for the areas of manufacturing, marketing, sales, and finance.

While GeckoSystems has been in the Development Stage, the Company has accumulated losses to date in excess of six million dollars. In contrast, the Japanese government has spent one hundred million dollars in grants (to Sanyo, Toshiba, Hitachi, Fujitsu, NEC, etc.) over the same time period to develop personal robots for their eldercare crisis, yet no viable solutions have been developed.

By the end of this year, the Company plans to complete productization of its CareBot offering with the introduction of its fourth generation personal robot, the CareBot 4.0 MSR. The Company expects to be the first personal robot developer and manufacturer in the world to begin in-home eldercare evaluation trials.

What Does a CareBot Do for the Care Giver?

The short answer is that it decreases the difficulty and stress for the caregiver that needs to watch over Grandma, Mom, or other family members most, if not much, of the time day in and day out due to concerns about their well being, safety, and security.

But, first let's look at some other labor saving, *automatic* home appliances most of us use routinely. For example, needing to do two or more necessary chores and/or activities at the same time, like laundering clothes and preparing supper.

The *automatic* washing machine needs no human intervention after the dirty clothes are placed in the washer, the laundry powder poured in, and the desired wash cycle set. Then, this labor saving appliance runs *automatically* until the washed clothes are ready to be placed in another labor saving home appliance, the *automatic* clothes dryer. While the clothes are being washed and/or dried, the caregiver prepares supper using several time saving home appliances like the microwave oven, "crock" pot, blender, and conventional stove, with possible convection oven capabilities.

After supper, the dirty pots, pans, and dishes are placed in the *automatic* dishwasher to be washed and dried while the family retires to the den to watch TV, and/or the kids to do homework. Later, perhaps after the

kids have gone to bed, the caregiver may then have the time to fold, sort, and put up the now freshly laundered clothes.

So what does a CareBot do for the caregiver? It is a new type of labor saving, time management *automatic* home appliance.

For example, the care giver frequently feels time stress when they need to go shopping for 2 or 3 hours, and are uncomfortable when they have to be away for more than an hour or so. Time stress is much worse for the caregiver with a frail elderly parent that must be reminded to take medications at certain times of the day. How can the caregiver be away for 3-4 hours when Grandma must take her prescribed medication every 2 or 3 hours? If the caregiver is trapped in traffic for an hour or two beyond the 2 or 3 they expected to be gone, this “time stress” can be very difficult for the caregiver to moderate.

Not infrequently, the primary caregiver has a 24 hour, 7 days a week responsibility. After weeks and weeks of this sometimes tedious, if not onerous routine, how does the caregiver get a “day off?” To bring in an outsider is expensive (easily \$75-125 per day for just 8 hours) and there is the concern that medication will be missed or the care receiver have an accident requiring immediate assistance by the caregiver, or someone they must designate. And the care receiver may be very resistant to a “stranger” coming in to her home and “running things.”

So what is it worth for a care receiver to have an *automatic* system to help take care of Grandma? Just 3 or 4 days a month “off” on a daylong shopping trip, a visit with friends, or just take in a movie would cost \$225-500 per month. And that scenario assumes that Grandma is willing to be taken care of by a “stranger” during those needed and appropriate days off.

So perhaps, an *automatic* caregiver, a CareBot, might be pretty handy, and potentially very cost effective from the primary caregiver’s perspective.

What Does a CareBot Do for the Care Receiver?

It’s a new kind of companion that always stays close to them enabling family and friends to care for them from afar. It tells them jokes, retells family anecdotes, reminds them to take medication, reminds them that family is coming over soon (or not at all), recites Bible verses, plays favorite songs and/or other music. It alerts them when unexpected visitors, or intruders are present. It notifies designated caregivers when a potentially harmful event has occurred, such as a fall, fire in the home, or simply been not found by the CareBot for too long. It responds to calls for help and notifies those that the caregiver determined should be immediately notified when any predetermined adverse event occurs.

The family can customize the personality of the CareBot. The voice’s cadence can be fast or slow. The intonation can be breathy, or abrupt. The voice’s volume can range from very loud to very soft. The response phrases from the CareBot for recognized words and phrases can be colloquial and/or unique to the family’s own heritage. The personality can range from brassy to timid depending on how the care giver, and others appropriate, chooses it to be.

Generally, the care receiver is pleased at the prospect of family being able to drop in for a “virtual visit” using the onboard webcam and video monitor for at home “video conferencing.” The care receiver may feel much more needed and appreciated when their far flung family and friends can “look in” on them any where in the world where they can get broadband internet access and simply chat for a bit.

Why is Grandma really interested in a CareBot? She wants to stay in her home, or her family’s home, as long as she possibly can. What’s that worth? Priceless. Or, an average nursing home is \$5,000 per month for an environment that is too often the beginning of a spiral downward in the care receiver’s health. That’s probably \$2-3K more per month for them to be placed where they really don’t want to be. Financial payback

on a CareBot? *Less than a year-* Emotional payback for the family to have this new *automatic* care giver?
Nearly instantaneous-

Special Note for Present and Prospective Investors:

GeckoSystems' management sincerely regrets the activities of some market makers and clearing houses failing to fill GCKO orders in a timely and legal fashion, seemingly to facilitate their "naked short selling" activities. The investment community should be aware that GeckoSystems' stock transfer agent, Continental Stock Transfer & Trust Company, accepted GeckoSystems as a Direct Registration System (DRS) Participant on July 24, 2009.

DRS provides for the electronic direct registration of securities in an investor's name on the books of the transfer agent or issuer. It allows shares to be transferred between a transfer agent and a broker electronically through the industry's DRS Profile Systems. Historically, investors hold their shares either in "street name" with their broker, or they are "registered shareholders" and have a certificate. Consequently, the Company is in a position, as a DRS participant, to readily identify those parties, hidden prior to DRS participation, engaging in "naked short selling" of GCKO stock.

"Recently it has been brought to management's attention by frustrated potential investors in GeckoSystems, that they were unable to get their GCKO buy orders filled in a timely fashion, if at all. Consequently due to these 'failures to deliver (FTD's),' we have set up a hot line, for the reporting of such instances, as they seem to occur simultaneously with the 'naked short selling' of GCKO stock. We have carefully managed this risk to the degree possible by attaining our trading symbol from a 15c2-11, becoming DTC eligible, and being a DRS Participant. We are appreciative of any support and insights interested parties may provide us by calling our toll free investor hot line number, 1-866-227-3268. We will listen intently and document the difficulties encountered very carefully," reassured Spencer.

Safe Harbor:

Statements regarding financial matters in this press release other than historical facts are "forward-looking statements" within the meaning of Section 27A of the Securities Act of 1933, Section 21E of the Securities Exchange Act of 1934, and as that term is defined in the Private Securities Litigation Reform Act of 1995. The Company intends that such statements about the Company's future expectations, including future revenues and earnings, technology efficacy and all other forward-looking statements be subject to the Safe Harbors created thereby. The Company is a development stage firm that continues to be dependent upon outside capital to sustain its existence. Since these statements (future operational results and sales) involve risks and uncertainties and are subject to change at any time, the Company's actual results may differ materially from expected results.
